Return and paste

Participant quick guide | Recorded demo | Version 1.7, prepared 16 October 2026

Already have a reply? In Check, find **External checks** in the Evidence box. Paste the full text into **SynthID results** or **OpenAI results**. Your text is kept immediately in this browser session. No upload back into SDA or extra save form is needed.

Following a check together

1. Open the prepared example. Use the example agreed with your facilitator. At Check, choose **Open recorded findings** if needed.

2. Choose a checker. Both checkers are visible together. Use **Download example**, then **Open SynthID Detector** or **Open OpenAI checker**. Choose the downloaded file on that service.

3. Return and paste. Copy the complete reply, including any error message, into the matching results box. Either checker, both where available, or a facilitator demonstration can support the discussion.

External uploads require agreed session arrangements. Google receives a file sent to SynthID Detector; OpenAI receives an image sent to its checker, including retained metadata. Each uses your account there, its current terms and any charges, separately from SDA's API accounts. Opening a link sends no media. Use the agreed prepared example, or follow the facilitator's demonstration.

Pages, slides and other media

For documents, choose **Material for SynthID** when offered, then **Download selected image**. Paste with the same page or slide selected; each has its own SynthID reply. Keep the complete document alongside it. The OpenAI shortcut is enabled for image examples only. A separately checked image reply can name its page or frame in the OpenAI box. For audio or video, review SynthID's current limits and the reply's stated coverage.

Keep your notes

Under **Take the findings with you**, choose PDF, PowerPoint or CSV and use the download button before changing examples, reloading or closing the page. In Developer, use **Download session with your notes**; original recorded-report downloads contain the earlier findings.

Replies stay separate from the recorded model scores. SDA keeps the text entered; it does not independently confirm the submitted file or service response. Leave a skipped check empty. Use the dedicated SynthID Detector here; the former Gemini chat shortcut has been removed from this demo.
